DUST INCIDENTS 2006–2017

U.S. Chemical Safety and Hazard Investigation Board

Number of Dust Incidents by Industry, 2006-2017

Summary of Methods

The CSB Dust Update 2018 data is a collection of 105 incidents that were compiled by our Incident Screening department over an 11-year period from 2006 through 2017. The CSB verified each incident through at least one of the following authoritative sources: Occupational Safety and Health Administration (OSHA) investigation, inspection and Integrated Management Information System reports; emergency response/fire department records; and facility documentation obtained through CSB records requests. An incident was included in the final count if the CSB obtained a record identifying that dust was

involved in the explosion or fire event. Furthermore, because the CSB did not review other publicly available datasets, the incidents identified herein likely do not represent all dust incidents that occurred during the same timeframe.

The CSB data was then categorized into one of several broad industry types. Note that an incident was categorized into “Other Industrial” if it occurred at an industrial facility but the specific industry type was not strongly represented in the data, while “Other” includes dust incidents that occurred in non-industrial commercial businesses.
